ABSTRACT

Apparatus and method for a radially attachable RF trap attached from a side to a shielded RF cable. In some embodiments, the RF trap creates a high impedance on the outer shield of the RF cable at a frequency of RF signals carried on at least one inner conductor of the cable. In some embodiments, an RF-trap apparatus for blocking stray signals on a shielded RF cable that has a peripheral shield conductor and an inner conductor for carrying RF signals includes: a case; an LC circuit having a resonance frequency equal to RF signals carried on the inner conductor; projections that pierce and connect the LC circuit to the shield conductor; and an attachment device that holds the case to the cable with the LC circuit electrically connected to the shield conductor of the shielded RF cable.

FIG. 1D

FIG. 1C

1

SNAP-ON COAXIAL CABLE BALUN AND METHOD FOR TRAPPING RF CURRENT ON OUTSIDE SHIELD OF COAX AFTER INSTALLATION

FIELD OF THE INVENTION

This invention relates to the field of radio-frequency balance/unbalance ("balun") circuitry and more specifically to a method and RF-trap apparatus that can be attached to an installed coaxial cable from the side rather than from over an end, and, in some embodiments, for adjusting the characteristics electrically and/or mechanically.

BACKGROUND OF THE INVENTION

As used herein, the term "balun" refers to a radio-frequency (RF) cable trap that blocks stray RF current from flowing on the outside of shield conductors of coaxial RF cables.

U.S. Pat. No. 6,605,775 to Seeber et al. issued Aug. 12, 2003 with the title "Floating radio frequency trap for shield currents" and is incorporated herein by reference. Seeber et al. describe a floating shield current trap that provides first and second concentric tubular conductors electrically connected to provide a resonance-induced high impedance of current flow in a path consisting of the inner and outer conductors and their junctions thereby suppressing coupled current flow on a shield of a conductor contained within the first inner tubular conductor.

U.S. Pat. No. 6,664,465 to Seeber issued Dec. 16, 2003 with the title "Tuning system for floating radio frequency trap" and is incorporated herein by reference. Seeber describes a floating shield current trap provides two resonance loops formed of split concentric tubular conductors joined radially at their axial ends. Adjustment of the separation of these loops provides a change in coupling between the loops effecting a simplified tuning of the resonance of the trap for different expected frequencies of interfering shield current.

U.S. Pat. No. 6,593,744 to Burl et al. issued Jul. 15, 2003 with the title "Multi-channel RF cable trap for magnetic resonance apparatus" and is incorporated herein by reference. Burl et al. describe a multi-channel RF cable trap that blocks stray RF current from flowing on shield conductors of coaxial RF cables of a magnetic resonance apparatus. An inductor is formed by a curved semi-rigid trough constructed of an insulating material coated with an electrically conducting layer. Preferably, the inductor and the cable follow an "S"-shaped path to facilitate good electromagnetic coupling. The RF cables are laid in the trough and the shield conductors inductively couple with the inductor. A capacitor and optional trim capacitor are connected across the trough of the inductor to form a resonant LC circuit tuned to the resonance frequency. The LC circuit inductively couples with the shield conductors to present a signal-attenuating high impedance at the resonance frequency. The resonant circuit is preferably contained in an RF-shielding box with removable lid.

Conventional electrical components that permitted one to vary resistance, inductance, and/or capacitance under electrical control typically have somewhat limited component values available and are not compatible with being located in high fields (e.g., the fields of 1 tesla or more that are typically found in high-energy physics experiments such as the \$9-billion Large Hadron Collider that has been 20 years in making and is still being modified to be able to operate).

2

Low-power circuits can use varactors (electrically variable capacitors), field-effect transistors (used as variable gain elements or variable resistors) and like components that are directly electrically-adjustable, for use in adjusting frequency, impedance or other circuit characteristics and parameters, however such components are often unsuitable or inoperative in high fields.

U.S. Pat. No. 6,495,069 issued Dec. 17, 2002 to Lussey et al. with the title "Polymer composition" and is incorporated herein by reference. Lussey et al. describe a polymer composition comprises at least one substantially non-conductive polymer and at least one electrically conductive filler and in the form of granules. Their elastomer material was proposed for devices for controlling or switching electric current, to avoid or limit disadvantages such as the generation of transients and sparks which are associated with the actuation of conventional mechanical switches. They described an electrical conductor composite providing conduction when subjected to mechanical stress or electrostatic charge but electrically insulating when quiescent comprising a granular composition each granule of which comprises at least one substantially non-conductive polymer and at least one electrically conductive filler and is electrically insulating when quiescent but conductive when subjected to mechanical stress. They did not propose a means for electrically activating such switches.

U.S. Pat. No. 8,299,681 to Snyder, Vaughan and Lemaire issued Oct. 30, 2012 with the title "Remotely adjustable reactive and resistive electrical elements and method" and is incorporated herein by reference. Snyder, Vaughan and Lemaire describe an apparatus and method that includes providing a variable-parameter electrical component in a high-field environment and based on an electrical signal, automatically moving a movable portion of the electrical component in relation to another portion of the electrical component to vary at least one of its parameters. In some embodiments, the moving uses a mechanical movement device (e.g., a linear positioner, rotary motor, or pump). In some embodiments of the method, the electrical component has a variable inductance, capacitance, and/or resistance. Some embodiments include using a computer that controls the moving of the movable portion of the electrical component in order to vary an electrical parameter of the electrical component. Some embodiments include using a feedback signal to provide feedback control in order to adjust and/or maintain the electrical parameter. Some embodiments include a non-magnetic positioner connected to an electrical component configured to have its RLC parameters varied by the positioner.

Conventional baluns are unitary structures that are slipped over an end of a cable and then soldered in place. This makes it difficult and inconvenient to install such a balun once both ends of the cable are connectorized and/or soldered in place.

There is a long-felt need for an RF cable trap that can be installed on a cable from the side and that blocks stray RF current from flowing on shield conductors of coaxial RF cables.

SUMMARY OF THE INVENTION

The present invention provides snap-on coaxial cable balun and method for trapping RF current on outside shield of coax after the cable is installed.

In some embodiments, one or more reactive elements of the snap-on balun of the present invention include adjustable parameters (e.g., capacitance and/or inductance) that are adjusted electrically. In other embodiments, the adjustable parameters (e.g., capacitance and/or inductance) are adjusted

mechanically using electrically controlled actuators. In some embodiments, these electrically controlled mechanical-movement devices (such as piezo-electrical linear motors, micro-electronic mechanical-system (MEMS) mechanical actuators or MEMS pumps) and other elements (which are used to make the resistors, inductors, capacitors, and/or antenna elements) include metals that have only substantially non-magnetic components such that the resistors, inductors, capacitors, robotic arms or similar mechanical devices, and/or antenna elements and the mechanical positioner(s) or pump(s) that adjust their variable values can be placed and operated within and/or near an extremely high electric field of many thousands of volts per meter (such as connected to or affecting electricity-transmission lines carrying hundreds of thousands of volts and very large currents), or extremely-high magnetic field such as within the very strong superconducting-wire magnets of high-energy particle-physics experiments (such as the Large Hadron Collider) or within magnets of a magnetic-resonance imaging machines, or during and after an electromagnetic pulse (EMP) from a nuclear event.

In other embodiments, the present invention provides the ability to adjust very sensitive circuits that do not involve high fields, but instead involve very low fields (such as within completely enclosed Faraday cages (which block low-frequency external fields) having radio-frequency (RF) shielding (which block high-frequency external fields) that are measuring very small parameters such as extremely low-voltage circuits where the presence of a person or magnetic mechanical movement device (such as a magnetic linear positioner, rotary motor, or pump) would change the field, but which use the mechanical movement device(s) to adjust the configuration of RLC (resistive-inductive-capacitive) components without modifying fields or introducing extraneous capacitances or inductances.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1A is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1B is a block diagram of RF trap apparatus, according to some embodiments of the present invention.

FIG. 1C is a perspective-view computer-model image of RF trap apparatus, according to some embodiments of the present invention.

FIG. 1D is an end-view computer-model image of RF trap apparatus, according to some embodiments of the present invention.

FIG. 1E is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1F is a block diagram of RF trap apparatus, according to some embodiments of the present invention.

FIG. 1G is a perspective view of a shielded cable having a plurality of inner conductors, according to some embodiments of the present invention.

FIG. 1H is a perspective front-end view computer-model image of RF trap apparatus, according to some embodiments of the present invention.

FIG. 1I is a perspective back-end view computer-model image of RF trap apparatus, according to some embodiments of the present invention.

FIG. 1J is a perspective view of a shielded cable having a single inner conductor, according to some embodiments of the present invention.

FIG. 1K is a perspective view of a RF trap system that has shielded cable wrapped with conductor tape that includes a

plurality of piercing points that conduct RF between the conductor tape and the shield of cable, according to some embodiments of the present invention.

FIG. 1L is an end cross section view of RF trap system wrapped with conductor tape that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1M is a perspective view of RF trap system wrapped with conductor tape, which uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1N is an end cross section view of RF trap system wrapped with conductor tape that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1O is a perspective view of RF trap system wrapped with conductor tape that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1P is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1Q is an end cross section view of RF trap system that uses a two-part, interlocking RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1R is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1S is an end cross section view of RF trap system that uses a two-part, interlocking RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1T is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1U is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1V is an end cross section view of RF trap system that uses a two-part, interlocking RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1W is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 1X is a block diagram of an RF trap system that uses an RF trap apparatus on a shielded cable, according to some embodiments of the present invention.

FIG. 2 is a block diagram of system that uses one or more drivers to drive signals to adjust the electrical parameters and/or resonant frequency of the LC circuit to which they are connected.

FIG. 3 is a schematic diagram of a transmission line used in some embodiments of the present invention.

FIG. 4A is a schematic diagram of a tee network used in some embodiments of the present invention.

FIG. 4B is a schematic diagram of a tee network used in some embodiments of the present invention.

FIG. 5A is a schematic diagram of a pi network used in some embodiments of the present invention.

FIG. 5B is a schematic diagram of another pi network used in some embodiments of the present invention.

FIG. 6A is a schematic diagram of a quad combiner used in some embodiments of the present invention.

FIG. 6B is a schematic diagram of another quad combiner used in some embodiments of the present invention.

5

FIG. 7A is a schematic diagram of a Wilkinson power splitter/combiner using quarter-wave transmission line segments used in some embodiments of the present invention.

FIG. 7B is schematic diagram of a Wilkinson power splitter/combiner using discrete capacitors and inductances used in some embodiments of the present invention.

FIG. 8 is a schematic diagram of a rat-race coupler using quarter-wave transmission line segments used in some embodiments of the present invention.

DESCRIPTION OF PREFERRED EMBODIMENTS

Although the following detailed description contains many specifics for the purpose of illustration, a person of ordinary skill in the art will appreciate that many variations and alterations to the following details are within the scope of the invention. Accordingly, the following preferred embodiments of the invention are set forth without any loss of generality to, and without imposing limitations upon the claimed invention. Further, in the following detailed description of the preferred embodiments, reference is made to the accompanying drawings that form a part hereof, and in which are shown by way of illustration specific embodiments in which the invention may be practiced. It is understood that other embodiments may be utilized and structural changes may be made without departing from the scope of the present invention.

The leading digit(s) of reference numbers appearing in the Figures generally corresponds to the Figure number in which that component is first introduced, such that the same reference number is used throughout to refer to an identical component which appears in multiple Figures. Signals and connections may be referred to by the same reference number or label, and the actual meaning will be clear from its use in the context of the description.

As used herein, a non-magnetic mechanical movement device is any electrically-controlled device (such as a linear positioner, rotary motor, or pump) made of materials that do not move (or move to a substantially negligible amount) due to a high magnetic field when subjected to the high magnetic field. Such devices can be placed within the high magnetic field of a magnetic-resonance machine or the superconducting magnet of a particle accelerator without the danger of the device moving due to the magnetic field and/or without the undesirable result of changing the magnetic field due to their presence. In many of the descriptions herein, the term "motor" (such as motor 140) will be used as an example of such a non-magnetic mechanical movement device, however one of skill in the art will recognize that in other embodiments, the "motor" can be implemented as a linear or rotary motor device using suitable linkages, or as a pump that uses a liquid or pneumatic fluid to effectuate the described movement.

FIG. 1A is a block diagram of an RF trap system 191 that uses an RF trap apparatus 101, having a case 130, on a shielded cable 99, according to some embodiments of the present invention. In some embodiments, cable 99 includes one or more inner conductors 93 covered with insulator layer 94, and a conductive shield 92 surrounding the insulator layer 94, and an outer insulator layer 91 surrounding the shield 92. In some embodiments, RF trap 101 includes a plurality of pi networks 181, each pi network including a pair of capacitors 122, each capacitor 122 connected between an outer conductor 124 and one of the piercing projections 120 that connects to shield 92 once the RF trap 101 is clamped onto cable 99. In some embodiments, the plurality of pi networks is tuned to a resonance frequency of an RF signal carried by the one or

6

more inner conductors 93. In some embodiments, this tuning creates a high impedance on the outside of the shield 92, thus suppressing RF currents in the shield 92, and/or suppressing RF radiation from shield 92. In some embodiments, the outer conductors 124 form the L component of the pi network shown in FIG. 6C.

In each of the embodiments shown herein, the LC circuits shown can be replaced by one or more of the LC networks shown in the others of the Figures. In some such embodiments, a plurality of such L, C, and transmission line elements are combined to achieve the desired trapping of RF currents on the outer surface of the shield of the shielded cable.

FIG. 1B is a block diagram of an RF trap apparatus 101 as described in the description of FIG. 1A above, according to some embodiments of the present invention.

FIG. 1C is a perspective-view computer-model image of RF trap apparatus 101, according to some embodiments of the present invention.

FIG. 1D is an end-view computer-model image of RF trap apparatus 101, according to some embodiments of the present invention.

FIG. 1E is a block diagram of an RF trap system 192 that uses an RF trap apparatus 101 on a shielded cable 99, according to some embodiments of the present invention.

FIG. 1F is a block diagram of an RF trap apparatus 102, according to some embodiments of the present invention.

FIG. 1G is a perspective view of a shielded cable 98, according to some embodiments of the present invention.

FIG. 1H is a perspective front view computer-model image of RF trap apparatus 101, according to some embodiments of the present invention.

FIG. 1I is a perspective end view computer-model image of RF trap apparatus 101, according to some embodiments of the present invention.

FIG. 1J is a perspective view of a shielded cable 99, according to some embodiments of the present invention.

FIG. 1K is a perspective view of a RF trap system 180 that has shielded cable 98 wrapped with conductor tape 150 that includes a plurality of piercing points that conduct RF between the conductor tape 150 and the shield of cable, according to some embodiments of the present invention.

FIG. 1L is an end cross section view of RF trap system 194 wrapped with conductor tape 150 that uses an RF trap apparatus 104 on a shielded cable 98, according to some embodiments of the present invention.

FIG. 1M is a perspective view of RF trap system 193 wrapped with conductor tape 150, that uses an RF trap apparatus 103 on a shielded cable 98, according to some embodiments of the present invention.

FIG. 1N is an end cross section view of RF trap system 195 wrapped with conductor tape 150 that uses an RF trap apparatus 105 on a shielded cable 98, according to some embodiments of the present invention. As shown in FIG. 1N, RF trap system 105 includes two parts 105A and 105B connected by hinges 152 and latches 151 that form an attachment device, that work along with penetrating projections 120 to hold the case to the shielded RF cable 98 with the LC circuit electrically connected to the shield conductor of the shielded RF cable.

FIG. 1O is an perspective view of RF trap system 195 wrapped with conductor tape 150 that uses an RF trap apparatus 105 on a shielded cable 98, according to some embodiments of the present invention. As shown in FIG. 1O, RF trap system 105 includes latches 151 on each junction of conductor tape 150.

FIG. 1P is a block diagram of an RF trap system **196** that uses an RF trap apparatus **106** on a shielded cable **99**, according to some embodiments of the present invention.

FIG. 1Q is an end cross section view of RF trap system **197** that uses a two-part, interlocking RF trap apparatus **107** on a shielded cable **98**, according to some embodiments of the present invention. As shown in FIG. 1Q, RF trap apparatus **107** includes two symmetrical parts **107A** and **107B** each having interlocking latches **131A** and **131B** on opposite sides of each of the two symmetrical parts **107A** and **107B** that form an attachment device configured to hold the case to the shielded RF cable and urge penetrating projections **120** to form the LC circuit electrically connected to the shield conductor of the shielded RF cable **98**.

FIG. 1R is a block diagram of an RF trap system **198** that uses an RF trap apparatus **108** on a shielded cable **99**, according to some embodiments of the present invention.

FIG. 1S is an end cross section view of RF trap system **199A** that uses a two-part, interlocking RF trap apparatus **109A** on a shielded cable **98**, according to some embodiments of the present invention.

FIG. 1T is a block diagram of an RF trap system **199B** that uses an RF trap apparatus **109B** on a shielded cable **99**, according to some embodiments of the present invention.

FIG. 1U is a block diagram of an RF trap system **199C** that uses an RF trap apparatus **109C** on a shielded cable **99**, according to some embodiments of the present invention.

FIG. 1V is an end cross section view of RF trap system **197B** that uses a two-part, interlocking RF trap apparatus **107B** on a shielded cable **98**, according to some embodiments of the present invention.

FIG. 1W is a block diagram of an RF trap system **199D** that uses an RF trap apparatus **109D** on a shielded cable **99**, according to some embodiments of the present invention.

FIG. 1X is a block diagram of an RF trap system **199E** that uses an RF trap apparatus **109E** on a shielded cable **99**, according to some embodiments of the present invention.

FIG. 2 is a system **201** that uses one or more drivers **210** to drive signals to adjust the electrical parameters and/or resonant frequency of the LC circuit **220** to which they are connected. In some embodiments, the diode **251** in series with inductance **252** is forward-biased (to include the inductance) or reverse biased (to exclude the inductance) by a variable amount of DC current to allow the inductance **252** to adjust the resonance frequency of the circuit that includes capacitors **253** and **255** and inductances **252** and **254**. Similarly, the diode **256** in series with inductance **257** is forward-biased (to include the inductance) or reverse biased (to exclude the inductance) by a variable amount of DC current to allow the inductance **252** to adjust the resonance frequency that part of the circuit. In some embodiments, a plurality of piercing elements **260**, each including a central piercing element **261** that conducts electricity to the core conductor **93** of coax **99**. An insulating layer **94** surrounds the conductor **93**, and insulating layer **262** of each point **260** extends into this insulating layer **94** in order to isolate conductor **261** from the shield **92**. An outer conductor **263** on each point **260** extends into the shield **92** to electrically conduct the RF trap signals from the shield to the RF trap **201**. In some embodiments, an additional outer insulating layer is provided outside conductor **263** of each point. In some embodiments, each of the electrically tunable circuits **220** includes a varactor capacitor and/or a diode in series with an inductor, whose parameters are electrically adjusted to tune a resonant frequency and set up a high-impedance condition on the outside of the shield.

In some of each of the embodiments described herein, the conductors are made of a conductive metal. In some such

embodiments, the conductive metal is non-magnetic, in order that the devices can be used in a high-Tesla magnetic field (e.g., 3 T, 7 T or 10 T and above).

FIG. 3, FIG. 4A, FIG. 4B, FIG. 5A, FIG. 5B, FIG. 6A, FIG. 6B, FIG. 7A, FIG. 7B and FIG. 8 are each LC networks, one or more of which are used singly or as one of a plurality of components distributed around the circumference of the balun as the LC network in some embodiments of the multi-part interlocking balun of the present invention. In some embodiments, such as shown in FIG. 1C, for example, the interlocking balun has two halves that are hinged along one side and that have interlocking latches **131A** and **131B** (as shown in FIG. 1Q) along the opposite side that form an attachment device configured to hold the case to the shielded RF cable with the LC circuit electrically connected to the shield conductor of the shielded RF cable **98**. In other embodiments, such as shown in FIG. 1Q, for example, the interlocking balun has two halves that are symmetrical and that have interlocking latches **131A** and **131B** as shown in FIG. 1Q along both sides.

FIG. 3 is a schematic diagram of a transmission line that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 4A is a schematic diagram of a tee network that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 4B is a schematic diagram of a tee network that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 5A is a schematic diagram of a pi network that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 5B is a schematic diagram of another pi network that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 6A is a schematic diagram of a quad combiner that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 6B is a schematic diagram of another quad combiner that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 7A is a schematic diagram of a Wilkinson power splitter/combiner using quarter-wave transmission line segments that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 7B is schematic diagram of a Wilkinson power splitter/combiner using discrete capacitors and inductances that is used in some embodiments of the snap-on RF trap balun of the present invention.

FIG. 8 is a schematic diagram of a rat-race coupler **801** using quarter-wave transmission line segments used in some embodiments of the present invention.

In some embodiments, the system of the present invention includes an RF trap having an LC circuit with one or more adjustable elements (e.g., the inductance and/or capacitance is adjustable), and in some embodiments, the adjustment mechanism includes one or more non-magnetic (e.g., piezoelectric) motors adjusted by its own respective motor controller(s) and feedback circuit(s) to robotically move mechanical parts (levers, hoops, sheets of resilient elastic material, and the like) to achieve robotic control within the high-field or sensitive-field environment in which the RLC and/or antenna elements are adjusted by their own respective motor controllers and feedback circuits. In some such embodiments, the system sets an initial set of parameters (for example, resistance, inductance, capacitance, dielectric shape, frequency, phase, gain/attenuation, temporal properties, spatial proper-

ties (the shape of magnetic or electric fields), pulse width, mechanical position and orientation, or other controlled parameter) and a feedback circuit senses the result (one or more characteristics or parameters) and automatically adjusts the components (for example, variable resistors, inductors, capacitors, antennas, dielectric shapes, mechanical positioners and the like) in the system to compensate or control the system to achieve a desired result (e.g., a radar signal, magnetic-resonance or electron-spin image, or other desired system output).

In some embodiments, the one or more non-magnetic (e.g., piezoelectric) motors actuate control over electrical switches, amplitude modulators, frequency controllers, phase controllers, gain controllers, frequency modulators and the like by using, for example, control of variable resistor(s), inductor(s), capacitor(s), antenna(s), dielectric shape(s), mechanical positioner(s) and the like.

In some embodiments, the system uses non-magnetic (e.g., piezoelectric) motors (or other mechanical-movement devices) that include linear actuators, rotary actuators, pumps (pneumatic (pressure or vacuum) and/or liquid pumps) and/or the like. In some embodiments, the system optionally includes non-magnetic sensors (e.g., using piezoelectric or other suitable technologies) that include linear strain gauges, rotary sensors, pressure or sound sensors (e.g., pneumatic (pressure or vacuum) and/or liquid), position sensors, light and image sensors, voltage or current sensors, and/or the like. In some embodiments, such actuator elements and/or sensor elements are used for remotely controlled robotic diagnosis and examination, surgery, biopsy, and the like in a medical environment (such as a magnetic-resonance machine).

In some embodiments, the present invention includes one or more of any one or more of the devices in any of the figures herein in a combined circuit that connects the described variable components, optionally including other conventional components.

In some embodiments, the present invention provides an RF trap for blocking stray signals on a shielded RF cable that has a peripheral shield conductor and at least one inner conductor for carrying RF signals, the RF trap including: a case; an LC circuit that is mounted to the case and that has a resonance frequency at a frequency of RF signals carried on the at least one inner conductor; a piercing structure electrically connected to the LC circuit and configured to pierce and electrically connect the LC circuit to the shield conductor of the shielded RF cable; and an attachment device configured to hold the case to the shielded RF cable with the LC circuit electrically connected to the shield conductor of the shielded RF cable.

In some embodiments, the present invention provides an RF-trap apparatus for blocking stray signals on a shielded RF cable that has a peripheral shield conductor and at least one inner conductor for carrying RF signals. This RF trap apparatus includes: a case; an LC circuit that is mounted to the case and that has a resonance frequency at a frequency of RF signals carried on the at least one inner conductor; a plurality of projections electrically connected to the LC circuit and configured to pierce and electrically connect the LC circuit to the shield conductor of the shielded RF cable; and an attachment device configured to hold the case to the shielded RF cable with the LC circuit electrically connected to the shield conductor of the shielded RF cable.

Some embodiments further include an automatic parameter-adjustment unit operatively coupled to the LC circuit and configured to adjust electrical parameters of the LC circuit to control the resonance frequency of the LC circuit.

Some embodiments further include an automatic parameter-adjustment unit that has a non-magnetic mechanical actuator operatively coupled to the LC circuit and configured to adjust electrical parameters of the LC circuit to control the resonance frequency of the LC circuit.

In some embodiments, the plurality of projections electrically connected to the LC circuit include a first plurality of pointed projections at a first end of the case and a second plurality of pointed projections at a second end of the case opposite the first.

In some embodiments, the plurality of projections electrically connected to the LC circuit include a first plurality of pointed projections at a first end of the case and a second plurality of pointed projections at a second end of the case opposite the first, wherein each one of the first plurality of pointed projections is capacitively coupled to a cylindrical conductor spaced apart from the shield conductor of the shielded RF cable, and wherein each one of the second plurality of pointed projections is capacitively coupled to the cylindrical conductor.

In some embodiments, the plurality of projections electrically connected to the LC circuit include a first plurality of pointed projections only at a first end of the case and no pointed projections at a second end of the case opposite the first, and the LC circuit includes a conductive cylinder that is electrically connected to first plurality of pointed projections only at a first end of the case.

In some embodiments, the LC circuit includes a plurality of pi networks arranged at different radial directions around the shielded RF cable.

In some embodiments, the LC circuit includes a plurality of Tee networks arranged at different radial directions around the shielded RF cable.

In some embodiments, the LC circuit includes a plurality of quad-coupler networks arranged at different radial directions around the shielded RF cable.

In some embodiments, the LC circuit includes a plurality of Wilkinson power-splitter-combiner networks arranged at different radial directions around the shielded RF cable.

In some embodiments, the LC circuit includes a plurality of rat-race-coupler networks arranged at different radial directions around the shielded RF cable.

In some embodiments, the present invention provides a method that includes: providing a case having an LC circuit that is mounted to the case and that has a resonance frequency at a frequency of RF signals carried on the at least one inner conductor; a piercing structure electrically connected to the LC circuit and configured to pierce and electrically connect the LC circuit to the shield conductor of the shielded RF cable; and an attachment device configured to hold the case to the shielded RF cable with the LC circuit electrically connected to the shield conductor of the shielded RF cable.

Some embodiments further include automatically adjusting electrical parameters of the LC circuit to adjust the resonance frequency.

Some embodiments further include automatically adjusting electrical parameters of the LC circuit to adjust the resonance frequency by moving a non-magnetic mechanical movement device.

In some embodiments of the method, the plurality of projections electrically connected to the LC circuit include a first plurality of pointed projections at a first end of the case and a second plurality of pointed projections at a second end of the case opposite the first.

In some embodiments of the method, the plurality of projections electrically connected to the LC circuit include a first plurality of pointed projections at a first end of the case and a

11

second plurality of pointed projections at a second end of the case opposite the first, wherein each one of the first plurality of pointed projections is capacitively coupled to a cylindrical conductor spaced apart from the shield conductor of the shielded RF cable, and wherein each one of the second plurality of pointed projections is capacitively coupled to the cylindrical conductor.

In some embodiments of the method, the plurality of projections electrically connected to the LC circuit include a first plurality of pointed projections only at a first end of the case and no pointed projections at a second end of the case opposite the first, and the LC circuit includes a conductive cylinder that is electrically connected to first plurality of pointed projections only at a first end of the case.

In some embodiments of the method, the LC circuit includes a plurality of pi networks arranged at different radial directions around the shielded RF cable.

In some embodiments, the LC circuit includes a plurality of Tee networks arranged at different radial directions around the shielded RF cable.

In some embodiments of the method, the LC circuit includes a plurality of quad-coupler networks arranged at different radial directions around the shielded RF cable.

In some embodiments of the method, the LC circuit includes a plurality of Wilkinson power-splitter-combiner networks arranged at different radial directions around the shielded RF cable.

In some embodiments of the method, the LC circuit includes a plurality of rat-race-coupler networks arranged at different radial directions around the shielded RF cable.

In some embodiments, the present invention provides a non-transitory computer-readable medium having instructions stored thereon for causing a suitably programmed information processor to execute a method that comprises: auto-controlling an electrical parameter of an LC circuit that is mounted to a case of a snap-on balun attached to a shielded RF cable that has a peripheral shield conductor and at least one inner conductor for carrying RF signals, wherein the LC circuit has a resonance frequency at a frequency of RF signals carried on the at least one inner conductor, wherein the case includes a piercing structure electrically connected to the LC circuit and configured to pierce and electrically connect the LC circuit to the shield conductor of the shielded RF cable.

In some embodiments of the computer-readable medium, the method further includes using a feedback signal operatively coupled to the programmable information-processing device to provide feedback control in order to maintain the electrical parameter of the LC circuit.

In some embodiments of the computer-readable medium, the method further includes controlling resistance, inductance and capacitance (RLC) values of the LC circuit.

It is to be understood that the above description is intended to be illustrative, and not restrictive. Although numerous characteristics and advantages of various embodiments as described herein have been set forth in the foregoing description, together with details of the structure and function of various embodiments, many other embodiments and changes to details will be apparent to those of skill in the art upon reviewing the above description. The scope of the invention should be, therefore, determined with reference to the appended claims, along with the full scope of equivalents to which such claims are entitled. In the appended claims, the terms "including" and "in which" are used as the plain-English equivalents of the respective terms "comprising" and "wherein," respectively. Moreover, the terms "first," "second," and "third," etc., are used merely as labels, and are not intended to impose numerical requirements on their objects.

12

What is claimed is:

1. An RF-trap apparatus for blocking stray signals on a shielded RF cable that has a peripheral shield conductor and at least one inner conductor for carrying RF signals, the RF trap apparatus comprising:

a case;

an LC circuit that is mounted to the case and that has a resonance frequency at a frequency of the RF signals carried on the at least one inner conductor;

a plurality of projections electrically connected to the LC circuit and configured to pierce and electrically connect the LC circuit to the shield conductor of the shielded RF cable; and

an attachment device configured to hold the case to the shielded RF cable with the LC circuit electrically connected to the shield conductor of the shielded RF cable.

2. The apparatus of claim 1, further comprising:

an automatic parameter-adjustment unit operatively coupled to the LC circuit and configured to adjust electrical parameters of the LC circuit to control the resonance frequency of the LC circuit.

3. The apparatus of claim 1, further comprising:

an automatic parameter-adjustment unit that has a non-magnetic mechanical actuator operatively coupled to the LC circuit and configured to adjust electrical parameters of the LC circuit to control the resonance frequency of the LC circuit.

4. The apparatus of claim 1, wherein the plurality of projections include a first plurality of pointed projections at a first end of the case and a second plurality of pointed projections at a second end of the case opposite the first end.

5. The apparatus of claim 1, wherein the plurality of projections include a first plurality of pointed projections at a first end of the case and a second plurality of pointed projections at a second end of the case opposite the first end, wherein each one of the first plurality of pointed projections is capacitively coupled to a cylindrical conductor spaced apart from the shield conductor of the shielded RF cable, and wherein each one of the second plurality of pointed projections is capacitively coupled to the cylindrical conductor.

6. The apparatus of claim 1, wherein the plurality of projections include a first plurality of pointed projections only at a first end of the case and no pointed projections at a second end of the case opposite the first end, and the LC circuit includes a conductive cylinder that is electrically connected to the first plurality of pointed projections only at the first end of the case.

7. The apparatus of claim 1, wherein the LC circuit includes a plurality of pi networks arranged at different radial directions around the shielded RF cable.

8. The apparatus of claim 1, wherein the LC circuit includes a plurality of Tee networks arranged at different radial directions around the shielded RF cable.

9. The apparatus of claim 1, wherein the LC circuit includes a plurality of quad-coupler networks arranged at different radial directions around the shielded RF cable.

10. The apparatus of claim 1, wherein the LC circuit includes a plurality of Wilkinson power-splitter-combiner networks arranged at different radial directions around the shielded RF cable.

11. A method comprising:

providing a case having an LC circuit that is mounted to the case and that has a resonance frequency at a frequency of RF signals carried on at least one inner conductor of a shielded RF cable;

13

a piercing structure electrically connected to the LC circuit and configured to pierce and electrically connect the LC circuit to a shield conductor of the shielded RF cable; and

an attachment device configured to hold the case to the shielded RF cable with the LC circuit electrically connected to the shield conductor of the shielded RF cable.

12. The method of claim 11, further comprising:

automatically adjusting electrical parameters of the LC circuit with an automatic parameter adjusting unit to adjust the resonance frequency.

13. The method of claim 11, further comprising:

automatically adjusting electrical parameters of the LC circuit to adjust the resonance frequency by moving a non-magnetic mechanical-movement device.

14. The method of claim 11, wherein the plurality of projections include a first plurality of pointed projections at a first end of the case and a second plurality of pointed projections at a second end of the case opposite the first end.

15. The method of claim 11, wherein the plurality of projections include a first plurality of pointed projections at a first end of the case and a second plurality of pointed projections at a second end of the case opposite the first end, wherein each one of the first plurality of pointed projections is capacitively coupled to a cylindrical conductor spaced apart from the shield conductor of the shielded RF cable, and wherein each one of the second plurality of pointed projections is capacitively coupled to the cylindrical conductor.

16. The method of claim 11, wherein the plurality of projections include a first plurality of pointed projections only at a first end of the case and no pointed projections at a second end of the case opposite the first end, and the LC circuit

14

includes a conductive cylinder that is electrically connected to the first plurality of pointed projections only at the first end of the case.

17. The method of claim 11, wherein the LC circuit includes a plurality of pi networks arranged at different radial directions around the shielded RF cable.

18. A non-transitory computer-readable medium having instructions stored thereon for causing a suitably programmed information processor to execute a method that comprises:

autocontrolling an electrical parameter of an LC circuit that is mounted to a case of a snap-on balun attached to a shielded RF cable that has a peripheral shield conductor and at least one inner conductor for carrying RF signals, wherein the LC circuit has a resonance frequency at a frequency of the RF signals carried on the at least one inner conductor, wherein the case includes a piercing structure electrically connected to the LC circuit and configured to pierce and electrically connect the LC circuit to the shield conductor of the shielded RF cable.

19. The computer-readable medium of claim 18, wherein the medium includes further instructions such that the method further includes using a feedback signal operatively coupled to the suitably programmed information processor to provide feedback control in order to maintain the electrical parameter of the LC circuit.

20. The computer-readable medium of claim 18, wherein the LC circuit is an RLC circuit that includes resistance, and wherein the medium includes further instructions such that the method further includes controlling resistance, inductance and capacitance (RLC) values of the RLC circuit.
